

BUSINESS CASE :- Target SQL

1. Import the dataset and do usual exploratory analysis steps like checking the structure & characteristics of the dataset

1.Data type of columns in a table :-

```
SELECT
    column_name, data_type
FROM
    model-bonsai-382608.retail_data.INFORMATION_SCHEMA.COLUMNS
where table_name='customers'
```

| Row | column_name | data_type |
|-----|--------------------------|-----------|
| 1 | customer_id | STRING |
| 2 | customer_unique_id | STRING |
| 3 | customer_zip_code_prefix | INT64 |
| 4 | customer_city | STRING |
| 5 | customer_state | STRING |

2.Time period for which the data is given:-

```
select min(order_purchase_timestamp) as opt1,
max(order_purchase_timestamp) as opt2 from `retail_data.orders`;
```

| Row | opt1 | opt2 |
|-----|-------------------------|-------------------------|
| 1 | 2016-09-04 21:15:19 UTC | 2018-10-17 17:30:18 UTC |

3. Cities and States of customers ordered during the given period :-

```
select distinct customer_city, customer_state
from `retail_data.customers`
```

| Row | customer_city | customer_state |
|-----|---------------|----------------|
| 1 | acu | RN |
| 2 | ico | CE |
| 3 | ipe | RS |
| 4 | ipu | CE |
| 5 | ita | SC |
| 6 | itu | SP |
| 7 | jau | SP |
| 8 | luz | MG |
| 9 | poa | SP |
| 10 | uba | MG |

2. In-depth Exploration:

1. Is there a growing trend on e-commerce in Brazil? How can we describe a complete scenario? Can we see some seasonality with peaks at specific months?

```

SELECT
  EXTRACT (YEAR FROM order_purchase_timestamp) AS year,
  EXTRACT (MONTH FROM order_purchase_timestamp) AS month,
  COUNT(*) as num_orders
FROM `retail_data.orders`
GROUP BY year,month
ORDER BY year,month

```

| Row | year | month | num_orders |
|-----|------|-------|------------|
| 1 | 2016 | 9 | 4 |
| 2 | 2016 | 10 | 324 |
| 3 | 2016 | 12 | 1 |
| 4 | 2017 | 1 | 800 |
| 5 | 2017 | 2 | 1780 |
| 6 | 2017 | 3 | 2682 |
| 7 | 2017 | 4 | 2404 |
| 8 | 2017 | 5 | 3700 |
| 9 | 2017 | 6 | 3245 |
| 10 | 2017 | 7 | 4026 |

Yes, there is growing trend on e commerce in brazil.

2. What time do Brazilian customers tend to buy (Dawn, Morning, Afternoon or Night)?

```
SELECT
```

```
    CASE
```

```
        WHEN EXTRACT(HOUR FROM order_purchase_timestamp) >= 0 AND EXTRACT(HOUR FROM
```

```
        order_purchase_timestamp) < 6 THEN 'Dawn'
```

```
        WHEN EXTRACT(HOUR FROM order_purchase_timestamp) >= 6 AND EXTRACT(HOUR FROM
```

```
        M order_purchase_timestamp) < 18 THEN 'Afternoon'
```

```
        WHEN EXTRACT(HOUR FROM order_purchase_timestamp) >= 18 AND EXTRACT(HOUR FRO
```

```
        M order_purchase_timestamp) <= 23 THEN 'Night'
```

```
        ELSE 'Unknown'
```

```
    END AS time_period,
```

```
    COUNT(*) AS num_orders
```

```
FROM `retail_data.orders`
```

```
GROUP BY time_period
```

```
ORDER BY num_orders DESC
```

| Row | time_period | num_orders |
|-----|-------------|------------|
| 1 | Afternoon | 38361 |
| 2 | Night | 34100 |
| 3 | Morning | 22240 |
| 4 | Dawn | 4740 |

3.Evolution of E-commerce orders in the Brazil region:

1. Get month on month orders by states:-

```

SELECT
    c.customer_state,
    EXTRACT(MONTH FROM o.order_purchase_timestamp) AS month,
    COUNT(*) AS num_of_orders
FROM
    `retail_data.orders` AS o
    JOIN `retail_data.customers` AS c ON c.customer_id = o.customer_id
GROUP BY
    c.customer_state,
    month

```

| Row | customer_state | month | num_of_orders |
|-----|----------------|-------|---------------|
| 1 | RJ | 11 | 1048 |
| 2 | RS | 12 | 283 |
| 3 | SP | 12 | 2357 |
| 4 | DF | 2 | 196 |
| 5 | PR | 11 | 378 |
| 6 | MT | 4 | 92 |
| 7 | MA | 7 | 79 |
| 8 | AL | 7 | 40 |
| 9 | SP | 7 | 4381 |
| 10 | MT | 7 | 85 |
| 11 | MG | 7 | 1111 |

2. Distribution of customers across the states in Brazil:-

```

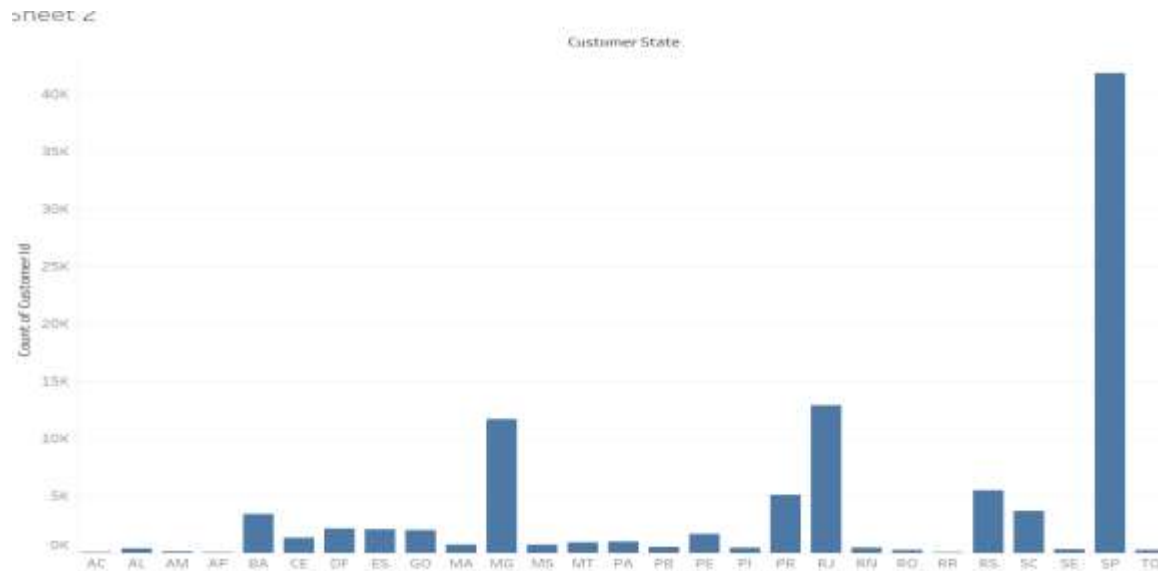

select t1.customer_state,t1.num_customers,t2.num_orders
from

(select
customer_state,count(customer_id) as num_customers from `retail_data.customers`
group by customer_state) as t1
join
(select c.customer_state,count(distinct o.order_id) as num_orders
from `retail_data.orders` o join `retail_data.customers` c on o.customer_id=c.customer_id group by c.customer_state ) as t2

on t1.customer_state=t2.customer_state

```

| Row | customer_state | num_customers |
|-----|----------------|---------------|
| 1 | RN | 485 |
| 2 | CE | 1336 |
| 3 | RS | 5466 |
| 4 | SC | 3637 |
| 5 | SP | 41746 |
| 6 | MG | 11635 |
| 7 | BA | 3380 |
| 8 | RJ | 12852 |
| 9 | GO | 2020 |
| 10 | MA | 747 |

4.Impact on Economy: Analyze the money movement by e-commerce by looking at order prices, freight and others.

1. Get % increase in cost of orders from 2017 to 2018 (include months between Jan to Aug only) - You can use “payment_value” column in payments table

```

WITH orders_2017 AS (
  SELECT
    EXTRACT(MONTH FROM o.order_purchase_timestamp) AS month,
    round(SUM(p.payment_value),2) AS total_payment_value_2017
  FROM `retail_data.orders` o
  INNER JOIN `retail_data.payments` p ON o.order_id = p.order_id
  WHERE EXTRACT(YEAR FROM o.order_purchase_timestamp) = 2017
    AND EXTRACT(MONTH FROM o.order_purchase_timestamp) BETWEEN 1 AND 8
  GROUP BY EXTRACT(MONTH FROM o.order_purchase_timestamp)
),
orders_2018 AS (
  SELECT
    EXTRACT(MONTH FROM o.order_purchase_timestamp) AS month,
    round(SUM(p.payment_value),2) AS total_payment_value_2018
  FROM `retail_data.orders` o
  INNER JOIN `retail_data.payments` p ON o.order_id = p.order_id
  WHERE EXTRACT(YEAR FROM o.order_purchase_timestamp) = 2018
    AND EXTRACT(MONTH FROM o.order_purchase_timestamp) BETWEEN 1 AND 8
  GROUP BY EXTRACT(MONTH FROM o.order_purchase_timestamp)
)
SELECT
  o1.month,

```

```

o1.total_payment_value_2017,
o2.total_payment_value_2018,
round(((o2.total_payment_value_2018 - o1.total_payment_value_2017) / o1
.total_payment_value_2017) * 100,2) AS percentage_increase
FROM orders_2017 as o1
INNER JOIN orders_2018 as o2 ON o1.month = o2.month
order by o1.MONTH;

```

| Row | month | total_payment_value_2017 | total_payment_value_2018 | percentage_increase |
|-----|-------|--------------------------|--------------------------|---------------------|
| 1 | 1 | 138488.04 | 1115004.18 | 705.13 |
| 2 | 2 | 291908.01 | 992463.34 | 239.99 |
| 3 | 3 | 449863.6 | 1159652.12 | 157.78 |
| 4 | 4 | 417788.03 | 1160785.48 | 177.84 |
| 5 | 5 | 592918.82 | 1153982.15 | 94.63 |
| 6 | 6 | 511276.38 | 1023880.5 | 100.26 |
| 7 | 7 | 592382.92 | 1066540.75 | 80.04 |
| 8 | 8 | 674396.32 | 1022425.32 | 51.61 |

2. Mean & Sum of price and freight value by customer state

```

select
c.customer_state,
avg(oi.price) as mean,
sum(oi.price) as sum_of_price,
avg(oi.freight_value) as average_freight_value
from `retail_data.customers` as c join `retail_data.orders`
as o on o.customer_id = c.customer_id
join `retail_data.order_items` as oi on oi.order_id=o.order_id
group by c.customer_state

```

| Row | customer_state | mean | sum_of_price | average_freight |
|-----|----------------|---------------|---------------|-----------------|
| 1 | RN | 156.965935... | 83034.9799... | 35.6523629... |
| 2 | CE | 153.758261... | 227254.709... | 32.7142016... |
| 3 | RS | 120.337453... | 750304.020... | 21.7358043... |
| 4 | SC | 124.653577... | 520553.340... | 21.4703687... |
| 5 | SP | 109.653629... | 5202955.05... | 15.1472753... |
| 6 | MG | 120.748574... | 1585308.02... | 20.6301668... |
| 7 | BA | 134.601208... | 511349.990... | 26.3639589... |
| 8 | RJ | 125.117818... | 1824092.66... | 20.9609239... |
| 9 | GO | 126.271731... | 294591.949... | 22.7668152... |
| 10 | MA | 145.204150... | 119648.219... | 38.2570024... |

5. Analysis on sales, freight and delivery time:-

1. Calculate days between purchasing, delivering and estimated delivery:-

```
select
order_id,
DATE_DIFF(order_delivered_customer_date,order_purchase_timestamp,DAY) AS
time_to_deliver,
DATE_DIFF(order_estimated_delivery_date,order_delivered_customer_date,DAY
) AS time_to_estimate_deliver,
DATE_DIFF(order_estimated_delivery_date,order_delivered_carrier_date,DAY)
AS time_to_estimate_deliver
from `retail_data.orders`
where order_delivered_customer_date is not null
order by time_to_deliver
```

| Row | order_id | time_to_deliver | time_to_estimate | time_to_estimate |
|-----|-------------------------------|-----------------|------------------|------------------|
| 1 | e65f1eeee1f52024ad1dcd034... | 0 | 9 | 10 |
| 2 | bb5a519e352b45b714192a02f... | 0 | 25 | 26 |
| 3 | 434cecee7d1a65fc65358a632... | 0 | 19 | 20 |
| 4 | d3ca7b82c922817b06e5ca211... | 0 | 11 | 12 |
| 5 | 1d893dd7ca5f77ebf5f59f0d20... | 0 | 10 | 10 |
| 6 | d5fbeedc85190ba88580d6f82... | 0 | 7 | 8 |
| 7 | 79e324907160caea526fd8b94... | 0 | 8 | 9 |
| 8 | 38c1e3d4ed6a13cd0cf612d4c... | 0 | 16 | 16 |
| 9 | 8339b608be0d84fca9d8da68b... | 0 | 27 | 27 |
| 10 | f349cdb62f69c3fae5c4d7d3f3... | 0 | 12 | 13 |

2. Find time_to_delivery & diff_estimated_delivery. Formula for the same given below:

- $\text{time_to_delivery} = \text{order_purchase_timestamp} - \text{order_delivered_customer_date}$
- $\text{diff_estimated_delivery} = \text{order_estimated_delivery_date} - \text{order_delivered_customer_date}$

```

select
abs(DATE_DIFF(order_purchase_timestamp,order_delivered_customer_date,day)
) as time_to_delivery,
abs(date_diff(order_estimated_delivery_date,order_delivered_customer_date
,day)) as diff_estimated_delivery
from `retail_data.orders`

```

| Row | diff_time_to_delj | diff_estimated_c |
|-----|-------------------|------------------|
| 1 | 7 | 45 |
| 2 | 7 | 44 |
| 3 | 10 | 41 |
| 4 | 6 | 29 |
| 5 | 20 | 40 |
| 6 | 10 | 48 |
| 7 | 28 | 29 |
| 8 | 9 | 35 |
| 9 | 10 | 41 |
| 10 | 6 | 41 |
| 11 | 6 | 35 |

3. Group data by state, take mean of freight_value, time_to_delivery, diff_estimated_delivery

```

select
c.customer_state,
round(avg(oi.freight_value),2) as mean,
round(Avg(date_diff(o.order_delivered_customer_date,o.order_purcha
se_timestamp,day)),2) as time_to_delivery,
round(avg(date_diff(o.order_estimated_delivery_date,o.order_delive
red_carrier_date,day)),2) as time_for_estimated_delivery
from `retail_data.customers` as c
  join `retail_data.orders` as o on c.customer_id=o.customer_id
  join `retail_data.order_items` as oi on oi.order_id=o.order_id
group by c.customer_state
order by mean

```

| Row | customer_state | mean | time_to_delivery | time_for_estimating |
|-----|----------------|-------|------------------|---------------------|
| 1 | SP | 15.15 | 8.26 | 15.68 |
| 2 | PR | 20.53 | 11.48 | 21.06 |
| 3 | MG | 20.63 | 11.52 | 21.0 |
| 4 | RJ | 20.96 | 14.69 | 22.72 |
| 5 | DF | 21.04 | 12.5 | 20.88 |
| 6 | SC | 21.47 | 14.52 | 22.1 |
| 7 | RS | 21.74 | 14.71 | 24.98 |
| 8 | ES | 22.06 | 15.19 | 21.8 |
| 9 | GO | 22.77 | 14.95 | 23.53 |
| 10 | MS | 23.37 | 15.11 | 22.51 |

4.Sort the data to get the following:

5.Top 5 states with highest/lowest average freight value - sort in desc/asc limit 5

HIGHEST AVERAGE FREIGHT VALUE

```
select c.customer_state,AVG(oi.freight_value) as avg_freight
from `retail_data.orders` as o
join `retail_data.customers` as c on c.customer_id=o.customer_id
join `retail_data.order_items` as oi on oi.order_id=o.order_id
group by c.customer_state
order by avg_freight desc
limit 5
```

| Row | customer_state | avg_freight |
|-----|----------------|---------------|
| 1 | RR | 42.9844230... |
| 2 | PB | 42.7238039... |
| 3 | RO | 41.0697122... |
| 4 | AC | 40.0733695... |
| 5 | PI | 39.1479704... |

LOWEST AVERAGE FREIGHT VALUE

```
select c.customer_state,AVG(oi.freight_value) as avg_freight
from `retail_data.orders` as o
join `retail_data.customers` as c on c.customer_id=o.customer_id
join `retail_data.order_items` as oi on oi.order_id=o.order_id
group by c.customer_state
order by avg_freight ASC
limit 5
```

| Row | customer_state | avg_freight |
|-----|----------------|---------------|
| 1 | SP | 15.1472753... |
| 2 | PR | 20.5316515... |
| 3 | MG | 20.6301668... |
| 4 | RJ | 20.9609239... |
| 5 | DF | 21.0413549... |

6. Top 5 states with highest/lowest average time to delivery

HIGHEST AVERAGE TIME FOR DELIVERY

```
select c.customer_state,AVG(date_diff(o.order_delivered_customer_date,
o.order_purchase_timestamp,day)) as time_to_delivery
from `retail_data.orders` as o
join `retail_data.customers` as c on c.customer_id=o.customer_id
group by c.customer_state
order by time_to_delivery desc
limit 5
```

| Row | customer_state | time_to_delivery |
|-----|----------------|------------------|
| 1 | RR | 28.9756097... |
| 2 | AP | 26.7313432... |
| 3 | AM | 25.9862068... |
| 4 | AL | 24.0403022... |
| 5 | PA | 23.3160676... |

LOWEST AVERAGE TIME FOR DELIVERY

```
select c.customer_state,AVG(date_diff(o.order_delivered_customer_date,
o.order_purchase_timestamp,day)) as time_to_delivery
from `retail_data.orders` as o
join `retail_data.customers` as c on c.customer_id=o.customer_id
group by c.customer_state
order by time_to_delivery desc
limit 5
```

| Row | customer_state | time_to_delivery |
|-----|----------------|------------------|
| 1 | SP | 8.29806148... |
| 2 | PR | 11.5267113... |
| 3 | MG | 11.5438132... |
| 4 | DF | 12.5091346... |
| 5 | SC | 14.4795601... |

7. Top 5 states where delivery is really fast/ not so fast compared to estimated date

```

WITH delivery_time AS (
    SELECT
        c.customer_state,
        CASE
            WHEN o.order_delivered_customer_date <= o.order_estimated_de
livery_date THEN 'Fast Delivery'
            ELSE 'Not so Fast Delivery'
        END AS delivery_status,
        FROM `retail_data.orders` as o join `retail_data.customers` as c
        on o.customer_id=c.customer_id
        WHERE o.order_delivered_customer_date IS NOT NULL
        GROUP BY c.customer_state, delivery_status
),
delivery_times_rank AS (
    SELECT
        customer_state,
        delivery_status,
        ROW_NUMBER() OVER (PARTITION BY delivery_status ) AS rank_of
        FROM delivery_time
)
SELECT
    customer_state,
    delivery_status,
FROM delivery_times_rank
WHERE rank_of <= 5
ORDER BY delivery_status desc

```

| Row | customer_state | delivery_status |
|-----|----------------|----------------------|
| 1 | MG | Not so Fast Delivery |
| 2 | SP | Not so Fast Delivery |
| 3 | CE | Not so Fast Delivery |
| 4 | SC | Not so Fast Delivery |
| 5 | PE | Not so Fast Delivery |
| 6 | RJ | Fast Delivery |
| 7 | SC | Fast Delivery |
| 8 | SP | Fast Delivery |
| 9 | GO | Fast Delivery |
| 10 | RS | Fast Delivery |

6. Payment type analysis:

1. Month over Month count of orders for different payment types:-

```

SELECT
  p.payment_type,
  EXTRACT(MONTH from o.order_purchase_timestamp) AS month,
  count(*) AS order_count
FROM
  `retail_data.orders` as o
JOIN `retail_data.payments` p ON o.order_id = p.order_id
GROUP BY
  p.payment_type,
  month
ORDER BY
  order_count desc

```

| Row | payment_type | month | order_count |
|-----|--------------|-------|-------------|
| 1 | credit_card | 5 | 8350 |
| 2 | credit_card | 8 | 8269 |
| 3 | credit_card | 7 | 7841 |
| 4 | credit_card | 3 | 7707 |
| 5 | credit_card | 4 | 7301 |
| 6 | credit_card | 6 | 7276 |
| 7 | credit_card | 2 | 6609 |
| 8 | credit_card | 1 | 6103 |
| 9 | credit_card | 11 | 5897 |
| 10 | credit_card | 12 | 4378 |
| 11 | credit_card | 10 | 3778 |
| 12 | credit_card | 9 | 3286 |
| 13 | UPI | 8 | 2077 |

Results per page: 50 1 - 50 of 50

We can see that orders are more ordered by payment type credit card

2. Count of orders based on the no. of payment installments

```
select payment_installments, count(order_id) as num_of_orders
from `retail_data.payments` as p
group by payment_installments
```

| Row | payment_installments | num_of_orders |
|-----|----------------------|---------------|
| 1 | 0 | 2 |
| 2 | 1 | 52546 |
| 3 | 2 | 12413 |
| 4 | 3 | 10461 |
| 5 | 4 | 7098 |
| 6 | 5 | 5239 |
| 7 | 6 | 3920 |
| 8 | 7 | 1626 |
| 9 | 8 | 4268 |
| 10 | 9 | 644 |
| 11 | 10 | 5328 |
| 12 | 11 | 23 |
| 13 | 12 | 133 |

Results per page: 50 1 - 24 of 24
